

Stochastic Processes

math-foundations / concept 31

1 Definitions

Definition 1 (Stochastic process). *Let $(\Omega, \mathcal{F}, P)$ be a probability space and $(S, \mathcal{S})$ a measurable state space. A stochastic process indexed by a set T (typically $T = \mathbb{N}$ or $T = [0, \infty)$) is a collection of random variables*

$$X = \{X_t : t \in T\}, \quad X_t : \Omega \rightarrow S \text{ measurable.}$$

For each fixed $\omega \in \Omega$, the function $t \mapsto X_t(\omega)$ is called a sample path.

Definition 2 (Markov property). *A stochastic process $\{X_n\}_{n \in \mathbb{N}}$ has the Markov property (with respect to its natural filtration) if for every $n \in \mathbb{N}$ and every measurable set $A \subseteq S$,*

$$P(X_{n+1} \in A \mid X_0, X_1, \dots, X_n) = P(X_{n+1} \in A \mid X_n).$$

Equivalently, given the present X_n , the future X_{n+1} is independent of the past $(X_0, \dots, X_{n-1})$.

Definition 3 (Martingale). *Let $\{\mathcal{F}_n\}_{n \in \mathbb{N}}$ be a filtration on $(\Omega, \mathcal{F}, P)$. A process $\{X_n\}$ is a martingale with respect to $\{\mathcal{F}_n\}$ if*

1. X_n is $\mathcal{F}_n$ -measurable for every n (adaptedness);
2. $E[|X_n|] < \infty$ for every n (integrability);
3. $E[X_{n+1} \mid \mathcal{F}_n] = X_n$ almost surely (fair-game property).

2 Simple Random Walk

Theorem 1. *The simple random walk $S_n = X_1 + \dots + X_n$ with iid $X_i \in \{-1, +1\}$ each with probability $1/2$ satisfies $E[S_n] = 0$ and $\text{Var}(S_n) = n$.*

Proof. Each summand X_i takes values ± 1 with equal probability, so

$$E[X_i] = (+1) \cdot \frac{1}{2} + (-1) \cdot \frac{1}{2} = 0,$$

and

$$E[X_i^2] = (+1)^2 \cdot \frac{1}{2} + (-1)^2 \cdot \frac{1}{2} = 1.$$

Hence $\text{Var}(X_i) = E[X_i^2] - (E[X_i])^2 = 1 - 0 = 1$.

By linearity of expectation,

$$E[S_n] = E\left[\sum_{i=1}^n X_i\right] = \sum_{i=1}^n E[X_i] = \sum_{i=1}^n 0 = 0.$$

Because the X_i are independent, all cross-covariances vanish: $\text{Cov}(X_i, X_j) = 0$ for $i \neq j$. The variance-of-a-sum identity therefore reduces to a sum of variances:

$$\text{Var}(S_n) = \text{Var}\left(\sum_{i=1}^n X_i\right) = \sum_{i=1}^n \text{Var}(X_i) + 2 \sum_{i < j} \text{Cov}(X_i, X_j) = \sum_{i=1}^n 1 + 0 = n.$$

This proves $E[S_n] = 0$ and $\text{Var}(S_n) = n$. □

Remark. The standard deviation of S_n grows like $\sqrt{n}$, which is the diffusive scaling underlying Brownian motion (concept 32) and the noise schedule of diffusion-based generative models.
